Section A. Introduction

The goal of California Climate Investments is to reduce greenhouse gas (GHG) emissions and further the purposes of the Global Warming Solutions Act of 2006, known as Assembly Bill (AB) 32. The California Air Resources Board (ARB) is responsible for providing the quantification methodology to estimate the GHG emission reductions and other benefits from projects receiving monies from the Greenhouse Gas Reduction Fund (GGRF). ARB staff periodically review each quantification methodology to evaluate its effectiveness and update methodologies to make them more robust, user-friendly, and appropriate to the projects being quantified.

For the Fiscal Year (FY) 2016-17 California Transportation Commission (CTC) Active Transportation Program (ATP), ARB staff developed this GHG emission reduction quantification methodology and ATP GHG Emission Reduction Calculator Tool to provide methods for estimating GHG emission reductions of each proposed project applying for GGRF funds (Section B), provide instruction for documenting and supporting the estimate (Section C), and outline the process for tracking and reporting GHG reductions once a project is funded (Section D).

Although FY 20116-17 GGRF funds were appropriated to the California Department of Transportation (Caltrans), CTC is statutorily required to adopt the guidelines and selection criteria for and define the types of projects eligible to be funded through ATP GGRF monies. Caltrans is responsible for reporting expected and actual GHG emission reductions to ARB.

This methodology is based on the "Methods to Find the Cost-Effectiveness of Funding Air Quality Projects for Evaluating Motor Vehicle Registration Fee Projects and Congestion Mitigation and Air Quality Improvement Projects" (CMAQ Methods) to estimate the reduction in vehicle miles traveled (VMT) and associated GHG emission reductions based on transportation characteristics of the proposed project. Projects will report the total project GHG emission reductions estimated using this methodology as well as the total project GHG emission reductions per dollar of GGRF funds requested.

ATP Project Types

The CTC ATP includes three project types that are eligible for GGRF funding, meet the objectives of ATP, and for which there are methods to quantify GHG emission reductions. ATP project types that are eligible to receive FY 2016-17 GGRF funding include:

- New pedestrian facilities,
- New bike paths or lanes (Class I, Class II, or Class IV); and
- New or expanded bike share.

Pedestrian and bike facility construction projects and bike share projects result in net GHG emission reductions by replacing auto trips with walking or bicycle trips, which reduce VMT. This quantification methodology includes methods for estimating GHG

emission reductions for the project types listed above.

Pedestrian facilities replace auto trips by providing or improving pedestrian access. An example is a pedestrian passageway over several lanes of heavy traffic providing safe walking access to adjacent activity centers.

GGRF eligible bike facilities include Class I, Class II, and Class IV bikeways, as defined below (from Assembly Bill 1193¹).

- Class I bike paths or shared-use paths provide a completely separated right-of-way designated for the exclusive use of bicycles and pedestrians with crossflows by motorists minimized.
- Class II bike lanes provide a restricted right-of-way designated for the
 exclusive or semi-exclusive use of bicycles with through travel by motor
 vehicles or pedestrians prohibited, but with vehicle parking and crossflows by
 pedestrians and motorists permitted.
- Class IV separated bikeways provide a right-of-way designated exclusively for bicycle travel adjacent to a roadway and which are protected from vehicular traffic by features such as grade separation, physical barriers, or on-street parking.

Multi-use projects (i.e., Class I Bike Path) that will result in reduced VMT from bicycle and pedestrian uses may account for both uses. Contiguous projects are considered to be a single project for quantification of GHG emission reductions.

Note that Class III bike routes, which provide a right-of-way designated by signs or permanent markings and shared with pedestrians and motorists, are not currently quantified in this methodology.

New and expanded bike share projects reduce VMT by providing access to bicycles and therefore replacing auto trips with bike trips.

Section B details the methods to use based on the project type(s) proposed.

Methodology Development

ARB developed this quantification methodology consistent with the guiding implementation principles of California Climate Investments, including ensuring transparency, accountability, and outreach and access for disadvantaged communities as described in ARB's Funding Guidelines for Agencies that Administer California

¹ Assembly Bill 1193, available at: https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201320140AB1193

Climate Investments (Funding Guidelines).² ARB and CTC developed this quantification methodology through a public process to estimate GHG emission reductions from ATP projects that qualify for GGRF funding and to track the results of ATP projects funded with GGRF monies. The implementing principles ensure that the methodology would:

- Apply at the project-level.
- Align with the project types proposed for funding with GGRF monies.
- Provide uniform methods to be applied statewide, and be accessible by all applicants.
- Reflect relationships between the ATP project types listed above, and GHG emissions reductions that are conservative and supported by empirical literature; and
- Use project-level data, where available and appropriate.

This is a new Quantification Methodology specific to CTC ATP Projects that are eligible for GGRF funding. The SGC AHSC Quantification Methodology and Calculator Tool for FY 2015-16 may not be used for this program.

ARB released a draft FY 2016-17 quantification methodology for public comment in October 2016. Public comments were considered with the development of this October 28, 2016 version of the quantification methodology, which now includes bike share as an additional project type.

Tools

This quantification methodology and the ATP GHG Calculator Tool are based on CMAQ Methods and estimate the reduction in VMT and associated GHG emission reductions based on transportation characteristics of the proposed project.

The CMAQ Methods are used statewide, are publicly available, and are subject to regular updates to incorporate new information. The CMAQ Methods are a set of equations for evaluating the cost-effectiveness of certain types of transportation projects, including bicycle paths, vanpools, and new bus service. The CMAQ Methods were developed by ARB and Caltrans, and are used statewide by transportation agencies to evaluate criteria pollutant emission reductions from transportation projects competing for State motor vehicle fee and federal CMAQ funding. The CMAQ Methods were used as the basis for developing the GHG emission reduction estimates for the ATP GGRF project types. The CMAQ Methods document can be downloaded from https://www.arb.ca.gov/. However, all of the equations and assumptions needed for this quantification method are included in this document and some assumptions have been modified, as necessary.

² Funding Guidelines for Agencies that Administer California Climate Investments, December 21, 2015

available at: https://www.arb.ca.gov/cc/capandtrade/auctionproceeds/arb-funding-guidelines-for-ca-climate-investments.pdf

Program Assistance

CTC, Caltrans, and/or ARB staff will review the quantification portions of the ATP GGRF supplemental project applications to ensure that the methods described in this document were properly applied to estimate the GHG emission reductions for the proposed project. Applicants should use the following resources for additional questions and comments:

- Questions on this document should be sent to GGRFProgram@arb.ca.gov.
- For more information on ARB's efforts to support implementation of GGRF investments, see: https://www.arb.ca.gov/auctionproceeds.
- For more information about ATP, contact Laurie Waters at <u>Laurie.Waters@dot.ca.gov</u> or 916-651-6145

Section B. Greenhouse Gas Quantification Methodology

This quantification methodology is provided for new or expanded connectivity projects (i.e., bicycle or pedestrian facilities) and bike share projects that reduce VMT. Table 1 describes this method by project type.

Table 1. Methods by ATP Project Type

Project Type / Method	Description
Bicycle Paths or Lanes	Bicycle paths (Class I), bicycle lanes (Class II), or separated bikeways (Class IV) that are targeted to reduce commute VMT and other auto travel. Emissions are reduced by replacing auto trips with bicycle trips.
Pedestrian Facilities	Pedestrian facilities reduce VMT by providing pedestrian access and replacing auto trips with walking trips.
Bike Share	Bike share projects reduce VMT by providing access to bicycles and replacing auto trips with bike trips.

ATP GHG Calculator Tool

Applicants must use the ATP GHG Calculator Tool to estimate GHG emission reductions associated with proposed GGRF-funded projects. An example project showing how to use the ATP GHG Calculator Tool is provided in Appendix A. The equations used to estimate VMT reductions are based on the CMAQ Methods and are provided in Appendix B. Information on the emission factors used to convert VMT reductions to GHG emission reductions is available in Appendix C. The ATP GHG calculator tool can be downloaded from:

https://www.arb.ca.gov/cc/capandtrade/auctionproceeds/guantification.htm.

Users should begin with the **Read Me** tab, which contains instructions and prompts users to enter project information. Key terms are defined in the **Definitions** tab. The **New Bike-Ped Infrastructure** tab and the **Bike Share** tab identify inputs required by the user, generally requiring project-specific data or assumptions. Input and output fields are color coded:

- Yellow fields indicate a direct user input is required.
- Green fields indicate a selection from a drop-down box is required.
- Gray fields indicate output or calculation fields that are automatically populated based on user entries and the calculation methods.

Details of calculation methods are provided in Appendix B.

Table 2 indicates which factors in the **New Bike-Ped Infrastructure** tab and the **Bike Share** tab require input from the applicant (" \checkmark "), which values are not applicable(shaded cells), and lists default values programmed into the ATP GHG calculator.

Table 2. Input Requirements by Project Type

	equirements by Project Type		evel Data Requi	red
Input	Description	Bike Infrastructure	Pedestrian Infrastructure	Bike Share
Year 1	First Year of Project	✓	✓	✓
Year F	Final Year of Useful Life	Class I/IV: 20 years Class II: 15 years	20 years	10 years
Days of operation per year of new service (D)	Days of use per year of new service	200	200	
Length of average auto trip reduced (L)	Length of bike or walk trip	1.8 miles	1.0 mile	1.8 miles
Average Daily Traffic (ADT)	Annual Average Daily Traffic (two-way traffic volume in trips/day on parallel road). Use applicable value from project data (Maximum = 30,000)	√	√	
Yr1 Trips	Total number of bike trips using bike share bikes expected in the first year of service			√
Adjustment Factor (A)	New Bike/Ped Infrastructure: Adjustment factor to account for bike/pedestrian use. Bike Share: Discount factor applied to annual ridership to account induced demand and non-utilitarian or commuting use	Refer to Table B-1 in Appendix B	Refer to Table B-1 in Appendix B	0.5
Activity Center Credit (C)	Activity Center Credit near project	Refer to Table B-2 in Appendix B	Refer to Table B-2 in Appendix B	

The **GHG Summary** tab displays the total project GHG emission reductions as well as the estimated total project GHG emission reductions per ATP GGRF dollar, per total GGRF dollar requested, and per total project cost, as described below.

• Total Project GHG Emission Reductions is equal to the sum of each of the GHG emissions reductions calculated in Section B and are automatically summed in the ATP GHG Calculator Tool in the GHG Summary tab.

 Total Project GHG Emission Reductions per Dollars of ATP GGRF Funds requested is calculated as:

<u>Total Project GHG Emission Reductions (Metric Tons (MT) of CO₂e)</u>
ATP GGRF Funds Requested (\$)

Applicants should enter the ATP GGRF Funds Requested (\$) for all project features into the ATP GHG Calculator Tool. This amount is equal to the amount of GGRF dollars the applicant is requesting from CTC ATP. The ATP GHG Calculator Tool will provide the Total Project GHG Emissions per ATP GGRF Funds Requested.

 Total Project GHG Emission Reductions per Dollars of GGRF Requested is calculated as:

> <u>Total Project GHG Emission Reductions (MT CO₂e)</u> Total GGRF Funds Requested (\$)

Applicants should enter the Total GGRF Funds Requested (\$) into the ATP GHG calculator for all project features. This amount is equal to the amount of GGRF dollars the applicant is requesting from CTC ATP, plus all GGRF dollars from other agencies that have previously been awarded to the same project and any GGRF dollars from agencies other than CTC that that project has or plans to apply for. For a list of GGRF funded programs, go to: https://www.arb.ca.gov/cc/capandtrade/auctionproceeds/ggrfprogrampage.htm.

If no other GGRF funds are requested, this will be the same amount as the ATP GGRF Funds Requested. The ATP GHG calculator will provide the Total Project GHG Emission Reductions per GGRF Funds Requested.

 Total Project GHG Emission Reductions per Dollar (Total Project Cost) is calculated as:

Total Project GHG Emission Reductions (MT CO_2e)

Total Project Cost (\$)

Applicants should enter the total project cost. The ATP GHG Calculator Tool will provide the Total Project GHG Emissions per Dollar.

Once the Methods have been completed, go to **Section C. Documentation**.

Section C. Documentation

In addition to ATP GGRF application requirements, applicants for GGRF funding are required to document results from the use of this quantification methodology, including supporting materials to verify the accuracy of project-specific inputs.

Applicants are required to provide electronic documentation that is complete and sufficient to allow the calculations to be reviewed and replicated. Paper copies of supporting materials must be available upon request by agency staff.

The following checklist is provided as a guide to applicants; additional data and/or information may be necessary to support project-specific input assumptions.

	Documentation Description	Completed
1.	Project description, including excerpts or specific references to the location in the main ATP application of the project information necessary to complete the applicable portions of the quantification methodology	
2.	Populated ATP GHG Calculator Tool file (in .xls or .xlsm) with worksheets applicable to the project populated (ensure that the GHG emission reductions and GHG emission reductions per GGRF funds requested fields in the summary worksheet contain calculated values)	
3.	If the Total GGRF Funds Requested are different than the ATP GGRF Funds Requested, identify the other GGRF program(s) where funding is sought, including the fiscal year of the application(s)	
4.	Any other information as necessary and appropriate to substantiate inputs	

Section D. Reporting after Funding Award

Accountability and transparency are essential elements for all GGRF CCI projects. As described in ARB's Funding Guidelines², each administering agency is required to track and report on the benefits of CCI funded under their program(s). Each project funded by the GGRF is expected to provide quantifiable GHG emission reductions. The previous sections of this document provide the methods and tools to estimate the GHG emission reductions of projects based on project characteristics and assumptions of expected conditions and activity levels. This section explains the minimum reporting requirements for Caltrans and ATP GGRF funding recipients as contracts are awarded and implemented, termed Phase 1, and after a project is completed, termed Phase 2. Table 2 shows the project phases and when reporting is required.

ATP GGRF funding recipients have the obligation to provide, or provide access to, data and information on project outcomes to Caltrans.

It is the responsibility of Caltrans to collect and compile project data from ATP GGRF funding recipients, including GHG emission reductions and information on benefits to disadvantaged communities.

Table 3. Quantification and Reporting by Project Phase

	Timeframe	Quantification Methods
Funding Allocation	Period from solicitation to selection of projects and funding awards. Applicant submits ATP GGRF supplemental project application to CTC by due date in solicitation materials.	All applicants use methods in ARB's quantification methodology to estimate the GHG emission reductions of the project.
Phase 1	Period from project award date through project completion date. Caltrans reports to ARB on an annual basis.	All funded projects use methods in ARB's quantification methodology to update initial estimate of GHG emission reductions, as needed, based on project changes.
Phase 2	Begins after Phase 1 is complete.	GHG reductions achieved are quantified and reported for a subset of funded projects.

Phase 1 reporting is required for all ATP GRRF funded projects. Caltrans will collect and submit data to ARB to satisfy Phase 1 reporting requirements. ATP GGRF funding recipients must report any changes that impact GHG emission reduction estimates (i.e., assumptions or quantities) to Caltrans prior to project completion.

Phase 2 reporting is required for only a subset of ATP GGRF funded projects and is intended to document actual project benefits achieved after the project becomes operational.

Phase 2 data collection and reporting will not be required for every project. Caltrans will be responsible for identifying the subset of individual projects that must complete Phase 2 reporting, identifying who will be responsible for collecting Phase 2 data, and for reporting the required information to ARB. ARB will work with Caltrans to address Phase 2 procedures, including but not limited to:

- The timelines for Phase 2 reporting, i.e., when does Phase 2 reporting begin, how long will Phase 2 reporting be needed.
- As applicable, approaches for determining the subset of projects that need Phase 2 reporting (i.e., how many X projects out of Y total projects are required to have Phase 2 reporting).
- Methods for monitoring or measuring the necessary data to quantify and document achieved GHG reductions and other select project benefits.
- Data to be collected, including data fields needed to support quantification of GHG emission benefits.
- Reporting requirements for transmitting the data to ARB or Caltrans for program transparency and use in reports.

Once the Phase 2 quantification method and data needs are determined, ARB will develop and post the final ARB approved Phase 2 methodology for use in Phase 2 reporting.

Appendix A. Example Project

Introduction

The following is a hypothetical project³ to demonstrate how the FY 2016-17 ATP GGRF Program Quantification Methodology would be applied. This example does not provide examples of the supporting documentation that is required of actual project applicants.

Overview of the proposed project

The proposed project is a new bike infrastructure project proposing the construction of 1 mile of Class II bike lane. The proposed project is located in Los Angeles and will be constructed in 2017. The project will cost \$700,000 to construct and the applicant does not have leverage funds. The road adjacent to the project has an ADT of 17,500 and there is a post office, a bank, a grocery store, and a church within ½ mile of the project site.

Methods to apply

The Bicycle Paths or Lanes, and Pedestrian Facilities quantification methodology, through the use of the **New Bike-Ped Infrastructure** tab of the ATP GHG Emission Reduction Calculator Tool, should be utilized to estimate the GHG emission reductions for this project.

To begin, project identification information should be entered into the user input cells on the **Read Me** tab of the tool.

Read Me Tab Enter the Project Name and the contact information for person who can answer project specific questions on the quantification calculations.

Project Name:	Example Project
Contact Name:	John Smith
Contact Phone Number:	(555) 555-5555
Contact Email:	JohnSmith@exampleproject.com
Date Completed:	10/28/2016

Next, utilizing Table 2 above, the project specific inputs for a Class II bike lane are compiled. The required inputs are as follows:

- The project is located within Los Angeles County
- The first year of project (Yr 1) is 2017
- Based on a useful life of 15 years, the final year of useful life (Yr F) is 2032
- Annual Days of Operation (D) is the default of 200 days
- Average Daily Traffic (ADT) is 17,500

_

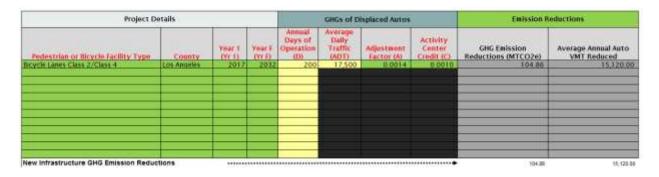

³ The hypothetical project has not undergone verification of any ATP or ATP GGRF Program requirements; all assumptions about location type and features are for quantification methodology demonstration purposes only.

- The population of Los Angeles is > 250,000, so the Adjustment Factor (A) for ≤ 1 mile of bike lane and an ADT of 17,500 is 0.0014
- The Activity Center Credit (C) for 4 activity centers within a ½ mile of the project site is 0.0010

Requested ATP GGRF Funds: \$700,000

Total GGRF Funds: \$700,000Total Project Cost: \$700,000

Once compiled, the project specific inputs listed above are entered into the user input cells on the **New Bike-Ped Infrastructure** tab of the tool.

Finally, the ATP GGRF Funds Requested (\$), Total GGRF Funds Requested (\$), and Total Project Cost (\$) are entered into the input cells on the **GHG Summary** tab of the tool. The GHG Summary tab of the tool will display Total GHG Emission Reductions per ATP GGRF Funds Requested, Total GHG Emission Reductions per Total GGRF Funds Requested, and Total GHG Emission Reductions per Total Project Cost.

	OHG Envissions (MT CO;#)	Description	Troubleshooting Tips
New Infrastructure GHG Emission Reductions	104.86		
Bike Share GHG Emission Reductions			
Total GHG Emission Reductions	104.86	Total GHG entesion reductions	"." may result from not entering information into all required cells in inputs Tab.
ATP OORF Funds Requested (8)	700.000.00	ATP GGRF Funds Requested for the proposed project	
Total GHG Emission Reductions ATP GGRF Funds Requested (\$)	0.00014980	Emission reductions per ATP GGRF funding requested	"VCNVID" results from not entering a value for ATP Funds Requested. "WALUE" results from a non-numeric entry in ATP Funds Requested.
Total GGRF Funds Requested (\$)		Trate custom Fulnas requestes for the proposed project. If you are applying, nake applied, or are planning to apply for additional GGRF funds for the proposed project, enter the combined funding request for all GGRF programs.	
Total GHG Emission Reductions Total GGRF Funds Requested (\$)	0 00014980	Emeaon reductions per total GGRF funding requested.	WONVOY results from out entering a value for Tutal GGRF Funds Requested. WALLIET results from a non-numeric entry in Tutal GGRF Funds Requested.
Total Project Cost (8)	700,000.00	Total cost of the proposed project.	
Total GHG Emission Reductions Total Project Cost (8)	0.00014980	Erassion reductions per total project Cost	"NOTWOP" results from not entering a value for Tinta Project Cost. "INVALUE!" results from a non-numeric entry in Total Project Cost.

Appendix B. Equations Supporting the LCTOP GHG Calculator Tool

ARB developed the ATP GHG calculator tool to automate calculations described in this quantification methodology. This appendix provides the equations used in the ATP GHG calculator tool.

Emission Factor Lookup Table

GGRF programs estimate transportation-related emissions using a "Well-to-Wheels" approach, which consists of emissions resulting from the production and distribution of different fuel types, including hydrogen and electricity, and any associated exhaust emissions. ATP Program applicants receiving GGRF funds use project-specific data to calculate new or avoided VMT, and VMT is converted to GHG emissions using Well-to-Wheels emission factors embedded in the ATP GHG calculator tool. The Lookup table used in the ATP GHG Calculator tool is attached as Appendix C. A detailed methodology of how the emission factors were developed is provided in Appendix C.

Bicycle Paths or Lanes, and Pedestrian Facilities

Annual VMT Reductions of Displaced Autos from Bicycle Paths/Lanes and Pedestrian Facilities

Auto VMT Reduced =
$$(D) * (ADT) * (A + C) * (L)$$
 (Eq. 1)

Where,

- **D** is the days of use per year (default is 200 days);
- **ADT** is the annual average daily traffic (two-way traffic volume in trips/day on parallel road). Use applicable value from project data (Maximum is 30.000):
- **A** is the adjustment factor to account for bike/ped use (use applicable value from Table A-1):
- **c** is the activity center credit (use applicable value from Table A-2); and
- L is the bike trip length (1.8 miles per trip in one direction) or walking trip length (1.0 miles per trip in one direction).

Table B- 1. Adjustment Factor (A) Lookup Table for Eq. 1

Average Daily Traffic (ADT)	Length of Bike/Ped Project (one direction)	A (for cities >250,000 and non-university towns <250,000)	A (for university towns with population <250,000)
ADT 40.000	≤ 1 mile	.0019	.0104
ADT ≤ 12,000 vehicles per day	> 1 & <u><</u> 2 miles	.0029	.0155
vernoies per day	> 2 miles	.0038	.0207

12,000 < ADT <	≤ 1 mile	.0014	.0073
24,000	> 1 & <u><</u> 2 miles	.0020	.0109
vehicles per day	> 2 miles	.0027	.0145
24,000 < ADT <	≤ 1 mile	.0010	.0052
30,000 vehicles per day	> 1 & <u><</u> 2 miles	.0014	.0078
Maximum is 30,000	> 2 miles	.0019	.0104

Table B- 2. Activity Center Credit (C) Lookup Table for Eq. 1

Count your Activity Centers. If there are	Within 1/2 mile of Project Area	Within 1/4 mile of Project Area
3	.0005	.001
More than 3 but fewer than 7	.0010	.002
7 or more	.0015	.003

Activity Center examples: Bank, church, hospital or HMO, light rail station (park & ride), office park, post office, public library, shopping area or grocery store, university, junior college, primary school, or secondary school. These metrics should be evaluated for the project location site and surrounding area which can extend a distance from the housing development not to exceed one-half (½) mile.

Auto GHG Reductions for Year 1 and Year F of the bike or pedestrian facility

$$Auto\ Reductions_{Yr1} = \frac{Auto\ VMT\ Reduced * AVEF_{Yr\ 1}}{1.000.000}$$
 (Eq. 2)

$$Auto\ Reductions_{YrF} = \frac{Auto\ VMT\ Reduced*AVEF_{Yr\ F}}{1,000,000}$$
 (Eq. 3)

Where.

AVEF is the auto vehicle emission factor, see Appendix C.

GHG Emission Reductions over the useful life of the project

$$GHG\ Emission\ Reductions = \frac{Auto\ Reductions_{Yr1}\ + Auto\ Reductions_{YrF}}{2} * UL \qquad \textbf{(Eq. 4)}$$

Where,

UL is the useful life, which is 20 years for Class I, 15 years for Class II and Class IV bicycle lanes, and 20 years for pedestrian facilities.

Bike Share

The GHG emission reductions from Bike Share projects that result in an increase in bike trips are calculated as the GHG emission reductions from displaced autos.

Auto VMT Reduced =
$$(T) * (A) * (L)$$
 (Eq. 5)

Where,

T is the total number of bike trips using bike share bikes expected in the first year of service;

A is the adjustment factor to account for induced demand and non-utilitarian and/or non-commute use (default is 0.5); and

L is the bike trip length (1.8 miles per trip in one direction).

Auto GHG Reductions for Year 1 and Year F of the bike share project

$$Auto\ Reductions_{Yr1} = \frac{Auto\ VMT\ Reduced*AVEF_{Yr\ 1}}{1,000,000}$$
 (Eq. 6)

$$Auto\ Reductions_{YrF} = \frac{Auto\ VMT\ Reduced*AVEF_{Yr\ F}}{1,000,000}$$
 (Eq. 7)

Where,

AVEF is the auto vehicle emission factor, see Appendix C.

GHG Emission Reductions over the useful life of the project

$$GHG\ Emission\ Reductions = \frac{Auto\ Reductions_{Yr1}\ + Auto\ Reductions_{YrF}}{2} * UL \qquad \textbf{(Eq. 8)}$$

Where,

UL is the useful life, which is 10 years for a bike share project.

Appendix C. Emission Factors

The emission factors were developed using fuel consumption rates from ARB's Mobile Source Emission Factor Model (EMFAC 2014)⁴ and carbon intensity values for different fuel types from ARB's Low Carbon Fuel Standard (LCFS) Program. This approach provides consistency amongst transportation-related GGRF programs and ARB's Low Carbon Fuel Standard (LCFS)⁵ Program.

The following sections provide details on how the emission factors were developed.

Auto Vehicle Emission Factors

Passenger (auto) vehicle emission factors (AVEF) were derived using the following steps.

- 1. Emissions by county for each calendar year from 2017 through 2050 were downloaded from EMFAC 2014 with the following parameters:
 - a. Annual Average
 - b. EMFAC2011 vehicle categories LDA, LDT1, LDT2, and MDV
 - c. Aggregated model year
 - d. Aggregated speed
 - e. Gasoline fuel
- 2. Calculate the auto fuel consumption rate (AFCR, in gallons of gasoline per mile) using the following equation:

$$AFCR = \frac{(FC_{LDA} + FC_{LDT1} + FC_{LDT2} + FC_{MDV})*1000}{VMT_{LDA} + VMT_{LDT1} + VMT_{LDT2} + VMT_{MDV}}$$
 (Eq. 9)

Where,

is the total fuel consumption for the vehicle type, in 1,000 gallons per day, from EMFAC 2014; and

VMT is the total vehicle miles traveled for the vehicle type, in miles per day, from EMFAC 2014.

3. Calculate the auto vehicle emission factors (AVEF, in grams of CO₂e per mile), using the following equation:

$$AVEF = 11,405.84 * AFCR$$
 (Eq. 10)

Note: 11,405.84 is the Well-to-wheels Carbon content factor for gasoline in g CO_2e per gallon of fasoline.
